

SUCCESS STORY

Grand Hotel Kempinski
secured by 2N

CHALLENGE

The **Grand Hotel Kempinski is a top 5-star luxury hotel in Riga**, situated in the heart of the Latvian capital. The elegant hotel has the finest collection of 141 luxury rooms and suites along with all-day dining, a rooftop restaurant and a luxury spa facility. The hotel management was looking for a new access control system based on IP network technology which would be reliable, stylish and easy to install. When our integration partner, **Datu tehnoloģiju grupa**, was asked to install the new access system, the brief was clear:

Provide an open, integrated and reliable solution

Luxurious appearance of the access units in the hotel interior

Focus on exclusivity and simple installation

Innovative functionality and easy administration

CONVENIENT AND SECURE ACCESS

The distribution centres gained a reliable IP access control system using the call button modules and integrated cameras, achieving a greater level of security and traffic efficiency. The intercom system includes an anti-vandal solution with the highest durability according to IP69K and IK10 standards.

MODULARITY

The 2N access system provides additional options for further access technologies that can be added in the future, e.g. Bluetooth module, Fingerprint Reader module or the 2N® Mobile Video application.

SIMPLE ADMINISTRATION

Intercoms and access control units can be set up remotely via 2N® Access Commander so that the security agency can monitor the hotel complex in real time.

When we were choosing the new access control system for our hotel, we were mainly interested in the latest products with cutting-edge technology and amazing design. That's why we selected 2N products. They met all of our requirements and fulfilled our expectations in terms of functionality and simple administration.

SOLUTION

Our partner decided to use products from the 2N portfolio to address this challenge:

2N® INDOOR TOUCH 2.0

2N® Indoor Touch 2.0 answering units were installed at the reception and in the superior exclusive hotel rooms, including The Presidential Suite. This stylish internal communicator comes with a 7" HD tempered glass display and Wi-Fi connectivity. It is the latest high-end model in 2N's line of answering units and is specifically designed for luxury apartments.

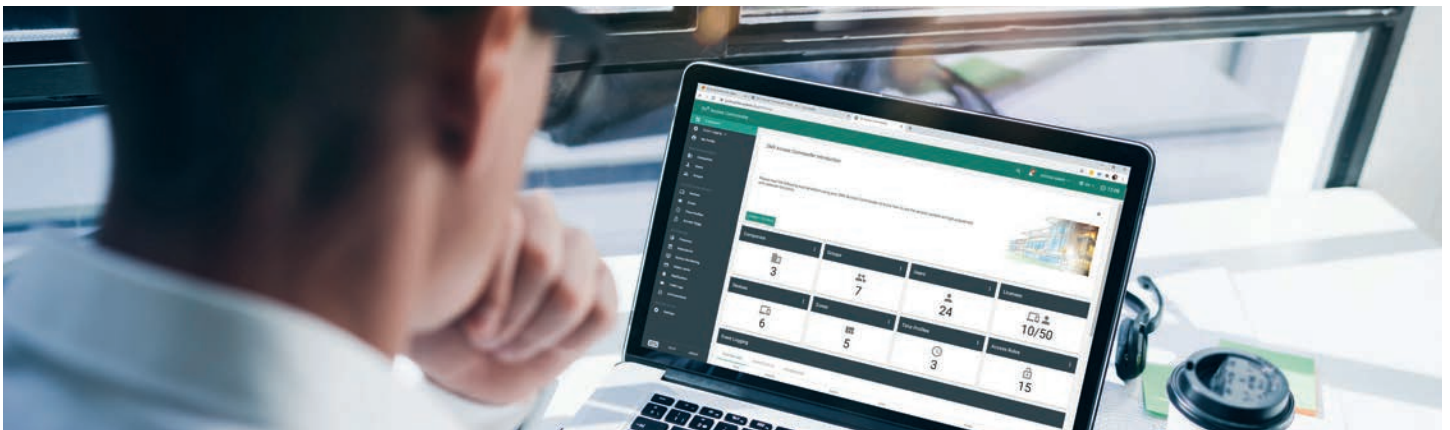

2N® IP VERSO

A 2N® IP Verso security intercom with a RFID reader was installed at the building's main entrances and The Presidential Suite. The IP Verso intercom was awarded the prestigious Red Dot Design Award and stands out for its modularity, luxury design and enhanced capabilities.

2N ACCESS UNIT 2.0

2N Access Units 2.0 RFID were installed at the service entrances for all employees. This allows the hotel management to grant special access to cleaners, staff or receptionists, and check who has entered each zone or door.

2N® ACCESS COMMANDER

The configuration and management of the complete access system is ensured by 2N® Access Commander. Through the graphical user interface, access permissions and specific functions are set in bulk, such as who has access to specific doors or zones. In due course, it would also be possible to add a time and attendance system which records the attendance of employees.
